## Features

## DIN-Rail Series

- 2 and 3-phase operation
- Input voltage range: 320 – 575VAC
- Output trim range: 22.5 – 29.5VDC
- High electrical strength; high reliability
- Permanent overload and short-circuit protection
- Parallel operation capability
- International safety certification listing

### Description

The REDIN/3AC is a series of rugged DIN rail power supplies for two and three-phase mains operation from 320 to 575VAC without the need of a neutral connection. Four versions with a maximum current limited output deliver 5A, 10A, 20A or 40A without derating up to +55°C. The output can be grounded via a third common output terminal. The LED signal on the front panel indicates that the output voltage remains within the wide adjustable range from 22.5 to 29.5VDC. The units are covered by international safety certificates and are intended for worldwide use. In power-hungry applications, the units can be connected in parallel with no need for additional components.

### Selection Guide

Part Number	nom. Input Voltage Range [VAC]	Output Voltage [VDC]	Output Adjustability [VDC]	Rated Current [A]	Efficiency <sup>(1)</sup> typ. [%]
REDIN240-24/3AC	400-500	24	22.5-29.5	10	88.5

#### Notes:

Note1: Efficiency is tested at nominal input and full load at +25°C ambient

Isolation Resistance		10MΩ min.	
Insulation Grade		reinforced	

**Notes:**

Note2: Refer to local wiring regulations if input over-current protection is also required

Note3: Under thermal overload conditions, the device does not switch off; instead, the output current is limited as much as necessary to return internal operating temperatures to safe limits. After the device cools down, full output capacity is automatically restored

2 Phase and 3 Phase Operation

3 Phase

2 Phase

Parallel Operation and Phase Redundancy

Parallel Operation

- 1) Adjust each power supply to the exact same output voltage with same load and cooling conditions.
- 2) Use the same wire length for each power supply (star connection) and energize all units at the same time to avoid triggering overload protection.
- 3) To prevent high reverse currents in the event of a secondary output fault, it is recommended to install a protective circuit at the output of each device when more than two power supplies are connected in parallel (e.g. decoupling diode or DC fuse).

For n parallel connected devices, the output current can be increased to 90% of  $n \times I_{nom}$ . A maximum of 5 devices can be connected in parallel.

Phase redundancy

- 1) If any single phase fails, operation is still guaranteed.
