

## TMUX1119 5V、低泄漏电流、2:1 精密开关

## 1 特性

- 宽电源电压范围：1.08V 至 5.5V
- 低漏电流：3pA
- 低导通电阻：1.8 Ω
- 低电荷注入：-6pC
- 工作温度范围：-40°C 至 +125°C
- 兼容 1.8V 逻辑电平
- 失效防护逻辑
- 轨到轨运行
- 双向信号路径
- 先断后合开关
- ESD 保护 HBM：2000V

## 2 应用

- 超声波扫描仪
- 患者监护和诊断
- 血糖监测仪
- 光学模块
- 光纤传输
- 远程无线电单元
- 数据采集系统
- 半导体测试设备
- 工厂自动化和工业控制
- 流量变送器
- 可编程逻辑控制器 (PLC)
- 模拟输入模块
- 电池测试

## 3 说明

TMUX1119 是一种互补金属氧化物半导体 (CMOS) 单极双投 (2:1) 开关。1.08V 至 5.5V 的宽工作电源电压范围使其适用于从医疗设备到工业系统的各种应用。该器件可在源极 (Sx) 和漏极 (D) 引脚上支持从 GND 到 V<sub>DD</sub> 范围的双向模拟和数字信号。所有逻辑输入均具有兼容 1.8V 逻辑的阈值，当器件在有效电源电压范围内运行时，这些阈值可实现 TTL 和 CMOS 逻辑兼容性。失效防护逻辑电路允许先在控制引脚上施加电压，然后在电源引脚上施加电压，从而保护器件免受潜在的损害。

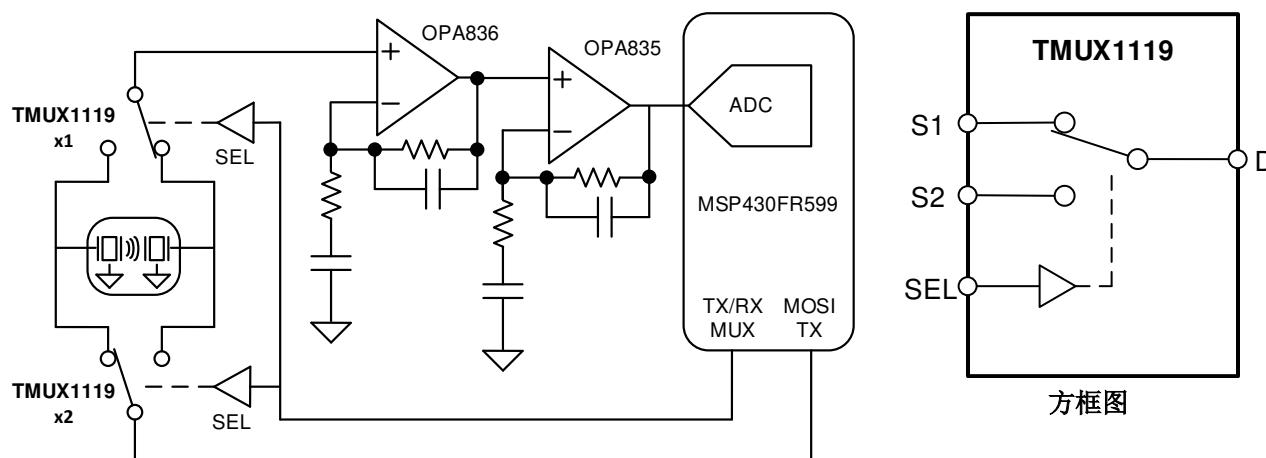

TMUX1119 是精密开关和多路复用器器件系列的一部分。这些器件具有非常低的导通和关断泄漏电流以及较低的电荷注入，因此可用于高精度测量应用。3nA 的低电源电流和小型封装选项使其可用于便携式应用。

## 封装信息

器件型号	封装 <sup>(1)</sup>	封装尺寸 <sup>(2)</sup>
TMUX1119	DCK (SC70, 6)	2mm × 2.1mm
	DBV (SOT-23, 6)	2.9mm × 2.8mm

(1) 有关详细信息，请参阅 [节 11](#)

(2) 封装尺寸 (长 × 宽) 为标称值，并包括引脚 (如适用)。

## 4 Pin Configuration and Functions

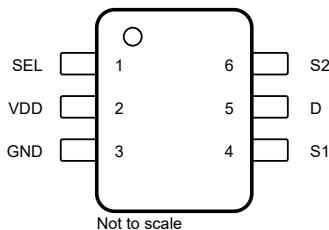

图 4-1. DCK Package, 6-Pin SC70 (Top View)

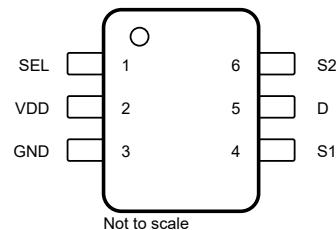

图 4-2. DBV Package, 6-Pin SOT-23 (Top View)

表 4-1. Pin Functions

PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
SEL	1	I	Select pin: controls state of the switch according to 表 7-1. (Logic Low = S1 to D, Logic High = S2 to D)
VDD	2	P	Positive power supply. This pin is the most positive power-supply potential. For reliable operation, connect a decoupling capacitor ranging from $0.1\mu F$ to $10\mu F$ between $V_{DD}$ and GND.
GND	3	P	Ground (0V) reference
S1	4	I/O	Source pin 1. Can be an input or output.
D	5	I/O	Drain pin. Can be an input or output.
S2	6	I/O	Source pin 2. Can be an input or output.

(1) I = input, O = output, I/O = input and output, P = power

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1) (2)</sup>

		MIN	MAX	UNIT
V <sub>DD</sub>	Supply voltage	- 0.5	6	V
V <sub>SEL</sub> or V <sub>EN</sub>	Logic control input pin voltage (SEL)	- 0.5	6	V
I <sub>SEL</sub> or I <sub>EN</sub>	Logic control input pin current (SEL)	- 30	30	mA
V <sub>S</sub> or V <sub>D</sub>	Source or drain voltage (Sx, D)	- 0.5	V <sub>DD</sub> +0.5	V
I <sub>S</sub> or I <sub>D</sub> (CONT)	Source or drain continuous current (Sx, D)	I <sub>DC</sub> ± 10 % <sup>(3)</sup>	I <sub>DC</sub> ± 10 % <sup>(3)</sup>	mA
I <sub>S</sub> or I <sub>D</sub> (PEAK)	Source and drain peak current: (1 ms period maximum, 10% duty cycle maximum) (Sx, D)	I <sub>peak</sub> ± 10 % <sup>(3)</sup>	I <sub>peak</sub> ± 10 % <sup>(3)</sup>	mA
T <sub>stg</sub>	Storage temperature	- 65	150	°C
P <sub>tot</sub>	Total power dissipation <sup>(4) (5)</sup>		300	mW
T <sub>J</sub>	Junction temperature		150	°C

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The algebraic convention, whereby the most negative value is a minimum and the most positive value is a maximum.

(3) Refer to Recommended Operating Conditions for I<sub>DC</sub> and I<sub>Peak</sub> ratings

(4) For DCK(SC70) package: P<sub>tot</sub> derates linearly above TA=77°C by 4.11mW/°C

(5) For DGS(SOT-23) package: P<sub>tot</sub> derates linearly above TA=86°C by 4.71mW/°C

### 5.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±750

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

## 6 Parameter Measurement Information

### 6.1 On-Resistance

The on-resistance of a device is the ohmic resistance between the source (Sx) and drain (D) pins of the device. The on-resistance varies with input voltage and supply voltage. The symbol  $R_{ON}$  is used to denote on-resistance. The measurement setup used to measure  $R_{ON}$  is shown in [图 6-1](#). Voltage (V) and current ( $I_{SD}$ ) are measured using this setup, and  $R_{ON}$  is computed with  $R_{ON} = V / I_{SD}$ :

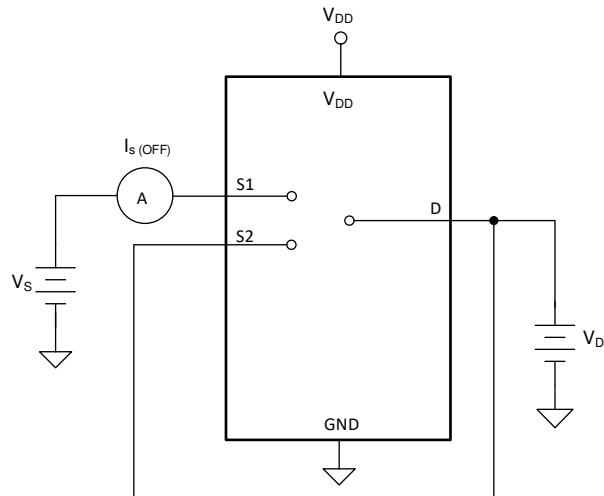

**图 6-1. On-Resistance Measurement Setup**

### 6.2 Off-Leakage Current

Source leakage current is defined as the leakage current flowing into or out of the source pin when the switch is off. This current is denoted by the symbol  $I_{S(OFF)}$ .

The setup used to measure off-leakage current is shown in [图 6-2](#).

**图 6-2. Off-Leakage Measurement Setup**

## 6.3 On-Leakage Current

Source on-leakage current is defined as the leakage current flowing into or out of the source pin when the switch is on. This current is denoted by the symbol  $I_{S(ON)}$ .

Drain on-leakage current is defined as the leakage current flowing into or out of the drain pin when the switch is on. This current is denoted by the symbol  $I_{D(ON)}$ .

Either the source pin or drain pin is left floating during the measurement. 图 6-3 shows the circuit used for measuring the on-leakage current, denoted by  $I_{S(ON)}$  or  $I_{D(ON)}$ .

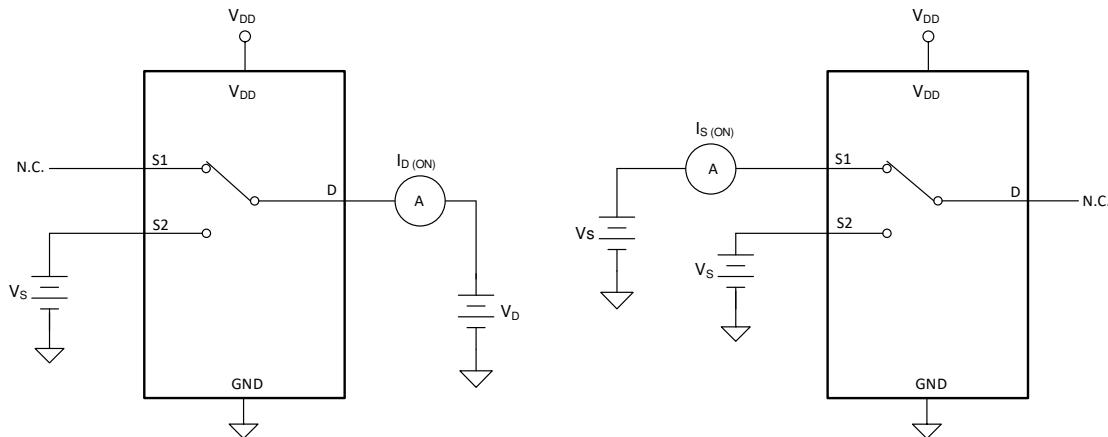

图 6-3. On-Leakage Measurement Setup

## 6.4 Transition Time

Transition time is defined as the time taken by the output of the device to rise or fall 10% after the address signal has risen or fallen past the logic threshold. The 10% transition measurement is utilized to provide the timing of the device. System level timing can then account for the time constant added from the load resistance and load capacitance. 图 6-4 shows the setup used to measure transition time, denoted by the symbol  $t_{TRANSITION}$ .

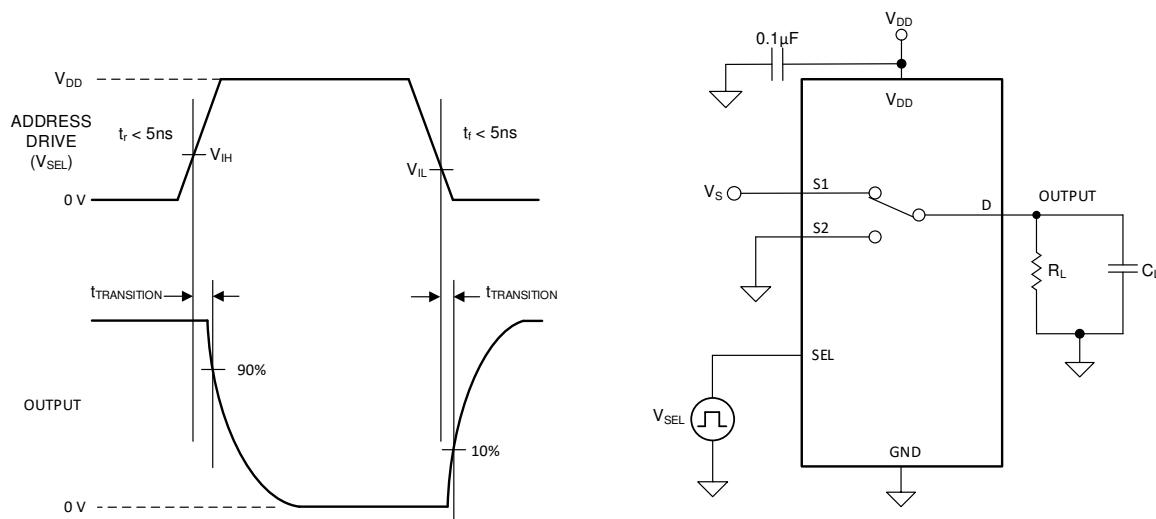

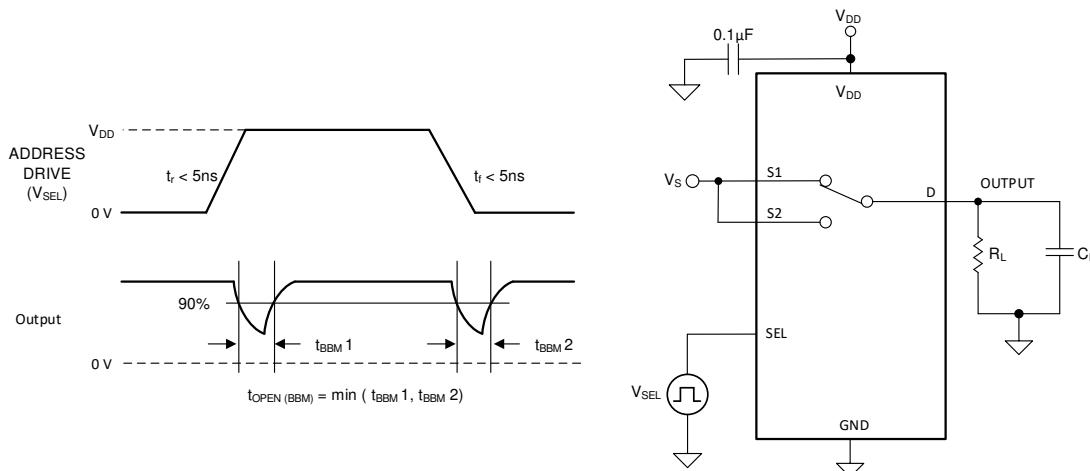

图 6-4. Transition-Time Measurement Setup

## 6.5 Break-Before-Make

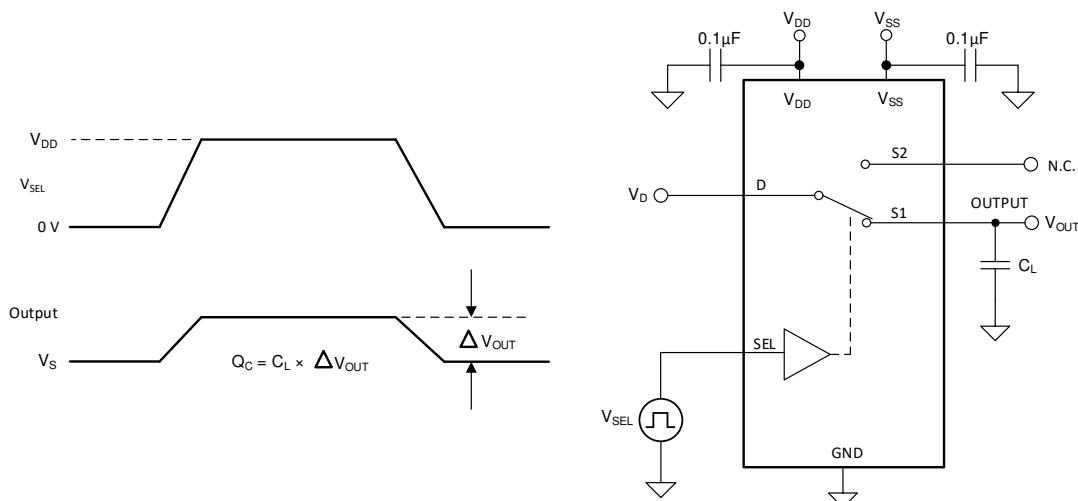

Break-before-make delay is a safety feature that prevents two inputs from connecting when the device is switching. The output first breaks from the on-state switch before making the connection with the next on-state switch. The time delay between the *break* and the *make* is known as break-before-make delay. [图 6-5](#) shows the setup used to measure break-before-make delay, denoted by the symbol  $t_{OPEN(BBM)}$ .

**图 6-5. Break-Before-Make Delay Measurement Setup**

## 6.6 Charge Injection

The TMUX1119 has a transmission-gate topology. Any mismatch in capacitance between the NMOS and PMOS transistors results in a charge injected into the drain or source during the falling or rising edge of the gate signal. The amount of charge injected into the source or drain of the device is known as charge injection, and is denoted by the symbol  $Q_C$ . [图 6-6](#) shows the setup used to measure charge injection from Drain (D) to Source (Sx).

**图 6-6. Charge-Injection Measurement Setup**

## 6.7 Off Isolation

Off isolation is defined as the ratio of the signal at the drain pin (D) of the device when a signal is applied to the source pin (Sx) of an off-channel. [图 6-7](#) shows the setup used to measure, and the equation used to calculate off isolation.

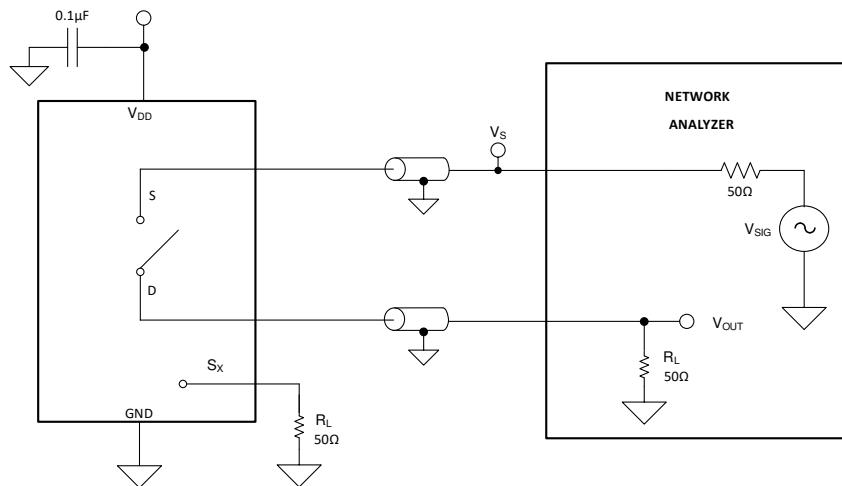

图 6-7. Off Isolation Measurement Setup

$$\text{Off Isolation} = 20 \cdot \log \left( \frac{V_{\text{OUT}}}{V_S} \right) \quad (1)$$

## 6.8 Crosstalk

Crosstalk is defined as the ratio of the signal at the drain pin (D) of a different channel, when a signal is applied at the source pin (Sx) of an on-channel. [图 6-8](#) shows the setup used to measure, and the equation used to calculate crosstalk.

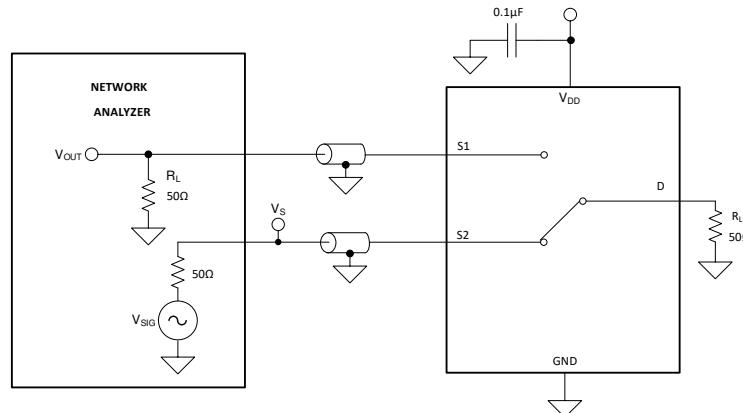

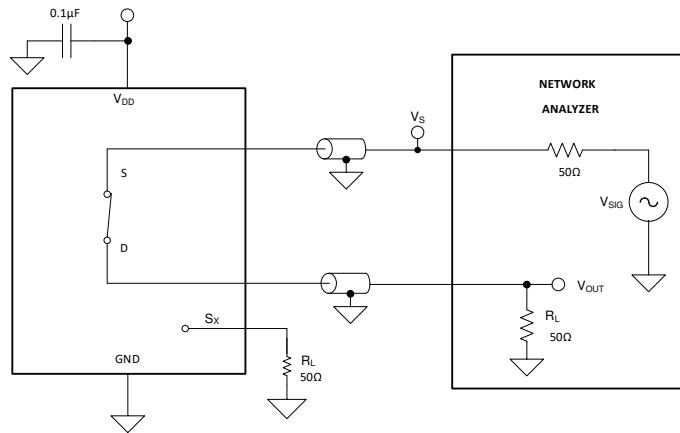

图 6-8. Crosstalk Measurement Setup

$$\text{Channel-to-Channel Crosstalk} = 20 \cdot \log\left(\frac{V_{\text{OUT}}}{V_{\text{S}}}\right) \quad (2)$$

## 6.9 Bandwidth

Bandwidth is defined as the range of frequencies that are attenuated by less than 3 dB when the input is applied to the source pin (Sx) of an on-channel, and the output is measured at the drain pin (D) of the device. [图 6-9](#) shows the setup used to measure bandwidth.

## 7 Detailed Description

### 7.1 Overview

The TMUX1119 is an 2:1, 1-ch. (SPDT), analog switch where the input is controlled with a single select (SEL) control pin.

### 7.2 Functional Block Diagram

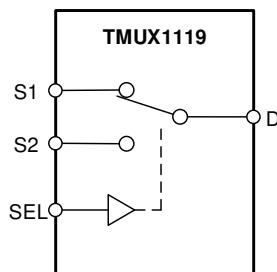

图 7-1. TMUX1119 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Bidirectional Operation

The TMUX1119 conducts equally well from source (Sx) to drain (D) or from drain (D) to source (Sx). The device has very similar characteristics in both directions and supports both analog and digital signals.

#### 7.3.2 Rail to Rail Operation

The valid signal path input/output voltage for TMUX1119 ranges from GND to  $V_{DD}$ .

#### 7.3.3 1.8V Logic Compatible Inputs

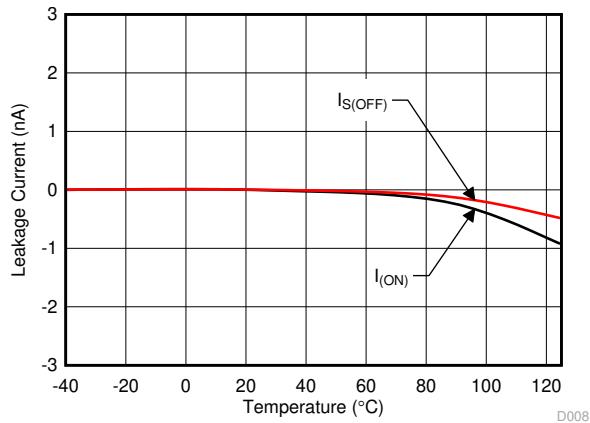

The TMUX1119 has 1.8V logic compatible control for the logic control input (SEL). The logic input threshold scales with supply but still provide 1.8V logic control when operating at 5.5V supply voltage. 1.8V logic level inputs allow the TMUX1119 to interface with processors that have lower logic I/O rails and eliminates the need for an external translator, which saves both space and BOM cost. For more information on 1.8V logic implementations refer to [Simplifying Design with 1.8V logic Muxes and Switches](#)

#### 7.3.4 Fail-Safe Logic

The TMUX1119 supports Fail-Safe Logic on the control input pin (SEL) allowing for operation up to 5.5V, regardless of the state of the supply pin. This feature allows voltages on the control pin to be applied before the supply pin, protecting the device from potential damage. Fail-Safe Logic minimizes system complexity by removing the need for power supply sequencing on the logic control pins. For example, the Fail-Safe Logic feature allows the select pin of the TMUX1119 to be ramped to 5.5V while  $V_{DD} = 0V$ . Additionally, the feature enables operation of the TMUX1119 with  $V_{DD} = 1.2V$  while allowing the select pin to interface with a logic level of another device up to 5.5V.

### 7.3.5 Ultra-Low Leakage Current

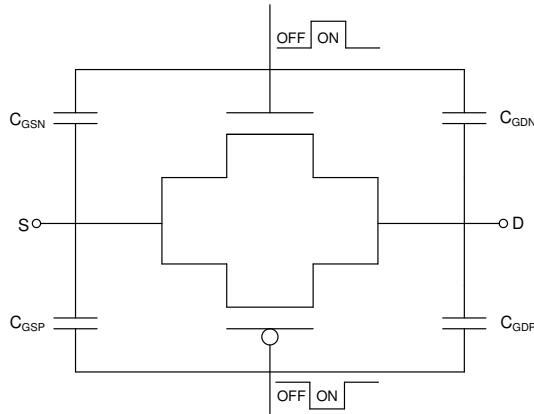

The TMUX1119 provides extremely low on-leakage and off-leakage currents. The TMUX1119 is capable of switching signals from high source-impedance inputs into a high input-impedance op amp with minimal offset error because of the ultra-low leakage currents. [图 7-2](#) shows typical leakage currents of the TMUX1119 versus temperature.

**图 7-2. Leakage Current vs Temperature**

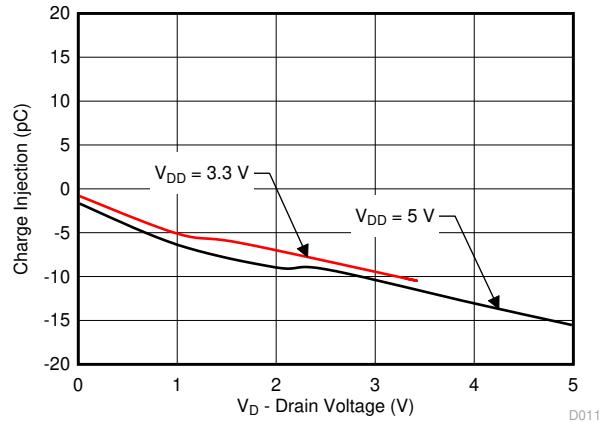

### 7.3.6 Ultra-Low Charge Injection

The TMUX1119 has a transmission gate topology, as shown in [图 7-3](#). Any mismatch in the stray capacitance associated with the NMOS and PMOS causes an output level change whenever the switch is opened or closed.

**图 7-3. Transmission Gate Topology**

The TMUX1119 has special charge-injection cancellation circuitry that reduces the drain-to-source charge injection to -6pC at  $V_D = 1V$  as shown in [图 7-4](#).

**图 7-4. Charge Injection vs Drain Voltage**

## 7.4 Device Functional Modes

The select (SEL) pin of the TMUX1119 controls which switch is connected to the drain of the device. When a given input is not selected, that source pin is in high impedance mode (HI-Z). The control pins can be as high as 5.5V.

## 8 Application and Implementation

### 备注

以下应用部分中的信息不属于 TI 元件规格，TI 不担保其准确性和完整性。TI 的客户负责确定元件是否适合其用途，以及验证和测试其设计实现以确认系统功能。

### 8.1 Application Information

The TMUX11xx family offers ultra-low input and output leakage currents and low charge injection. These devices operate up to 5.5V, and offer true rail-to-rail input and output of both analog and digital signals. The TMUX1119 has a low on-capacitance which allows faster settling time when multiplexing inputs in the time domain. These features make the TMUX11xx devices a family of precision, high-performance switches and multiplexers for low-voltage applications.

### 8.2 Typical Application

图 8-1 shows an ultrasonic gas meter front end. The ultrasonic front end design utilizes time of flight (TOF) measurement to determine the amount of gas flowing in a pipe. The circuit utilizes the MSP430FR5994, two ultra low power operational amplifiers, OPA835 and OPA836, along with two TMUX1119, 2:1 precision switches.

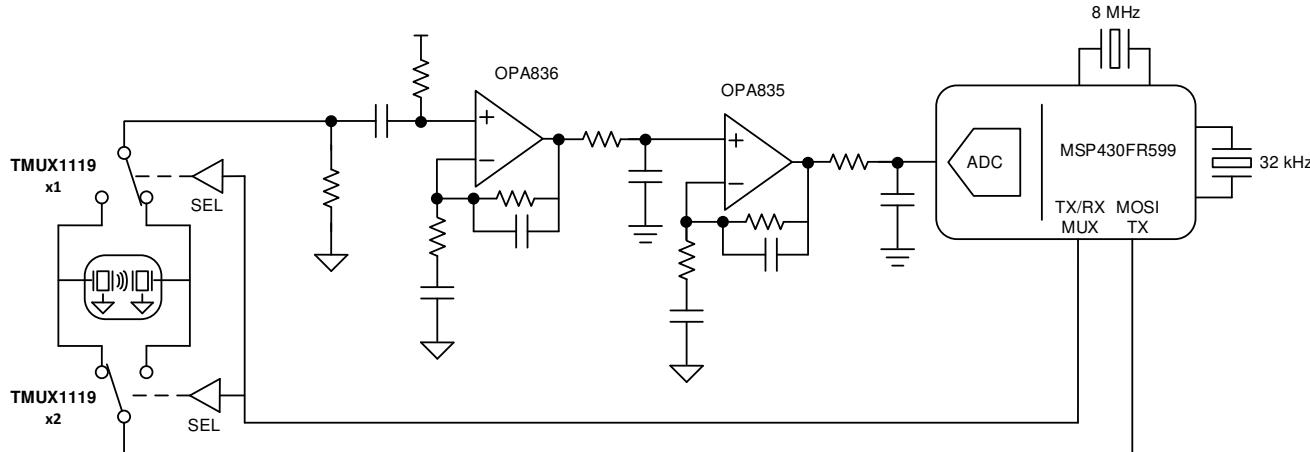

图 8-1. Ultrasonic Gas Meter System

#### 8.2.1 Design Requirements

For this design example, use the parameters listed in 表 8-1.

表 8-1. Design Parameters

PARAMETERS	VALUES
Supply ( $V_{DD}$ )	5V
I/O signal range	0V to $V_{DD}$ (Rail to Rail)
Control logic thresholds	1.8V compatible
Single-shot standard deviation (STD)	<2ns
Zero-flow drift (ZFD)	<1ns

### 8.2.2 Detailed Design Procedure

The TMUX1119 can be operated without any external components except for the supply decoupling capacitors. All inputs passing through the switch must fall within the recommended operating conditions of the TMUX1119, including signal range and continuous current. For this design with a supply of 5V the signal range can be 0V to 5V, and the maximum continuous current can be 30mA.

The TMUX1119 device is a bidirectional, single-pole double-throw (SPDT) switch that offers low on-resistance, low leakage, and low power. These features make this device suitable for portable and power sensitive applications such as ultrasonic gas metering systems. The two TMUX1119 devices are used to switch the transmission and reception signals from the MCU to the two transceivers in an efficient manner without distortion. Exceptional on-resistance flatness, leakage performance, and charge injection allows the TMUX1119 to be utilized in place of the TS5A9411 in [Ultrasonic Gas Meter Front-End With MSP430™ Reference Design](#). For a more detailed analysis of the entire system refer to the [reference design](#).

### 8.2.3 Application Curve

The TMUX1119 is capable of switching signals with minimal distortion because of the ultra-low leakage currents and excellent On-resistance flatness. [图 8-2](#) shows how the on-resistance of the TMUX1119 varies with different supply voltages.

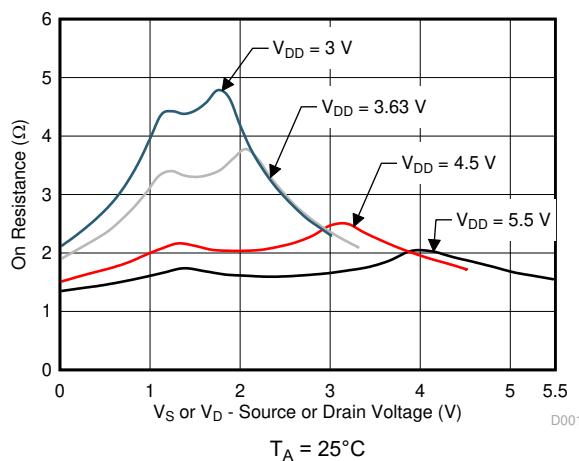

图 8-2. On-Leakage vs Source or Drain Voltage

### 8.3 Power Supply Recommendations

The TMUX1119 operates across a wide supply range of 1.08V to 5.5V. Do not exceed the absolute maximum ratings because stresses beyond the listed ratings can cause permanent damage to the devices.

Power-supply bypassing improves noise margin and prevents switching noise propagation from the V<sub>DD</sub> supply to other components. Good power-supply decoupling is important to achieve optimum performance. For improved supply noise immunity, use a supply decoupling capacitor ranging from 0.1  $\mu$  F to 10  $\mu$  F from V<sub>DD</sub> to ground. Place the bypass capacitors as close to the power supply pins of the device as possible using low-impedance connections. TI recommends using multi-layer ceramic chip capacitors (MLCCs) that offer low equivalent series resistance (ESR) and inductance (ESL) characteristics for power-supply decoupling purposes. For very sensitive systems, or for systems in harsh noise environments, avoiding the use of vias for connecting the capacitors to the device pins may offer superior noise immunity. The use of multiple vias in parallel lowers the overall inductance and is beneficial for connections to ground planes.

## 8.4 Layout

### 8.4.1 Layout Guidelines

When a PCB trace turns a corner at a 90° angle, a reflection can occur. A reflection occurs primarily because of the change of width of the trace. At the apex of the turn, the trace width increases to 1.414 times the width. This increase upsets the transmission-line characteristics, especially the distributed capacitance and self – inductance of the trace which results in the reflection. Not all PCB traces can be straight and therefore some traces must turn corners. [图 8-3](#) shows progressively better techniques of rounding corners. Only the last example (BEST) maintains constant trace width and minimizes reflections.

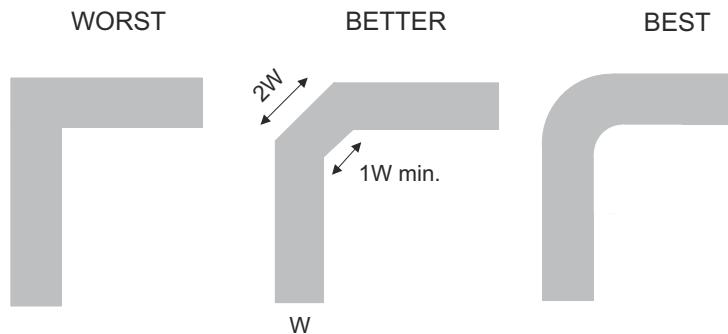

图 8-3. Trace Example

Route high-speed signals using a minimum of vias and corners which reduces signal reflections and impedance changes. When a via must be used, increase the clearance size around it to minimize its capacitance. Each via introduces discontinuities in the signal's transmission line and increases the chance of picking up interference from the other layers of the board. Be careful when designing test points, through-hole pins are not recommended at high frequencies.

[图 8-4](#) shows an example of a PCB layout with the TMUX1119. Some key considerations are as follows:

- Decouple the  $V_{DD}$  pin with a  $0.1\mu F$  capacitor, placed as close to the pin as possible. Ensure that the capacitor voltage rating is sufficient for the  $V_{DD}$  supply.
- Keep the input lines as short as possible.
- Use a solid ground plane to help reduce electromagnetic interference (EMI) noise pickup.
- Do not run sensitive analog traces in parallel with digital traces. Avoid crossing digital and analog traces if possible, and only make perpendicular crossings when necessary.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

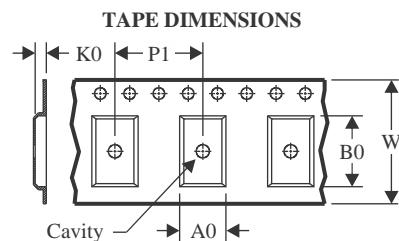

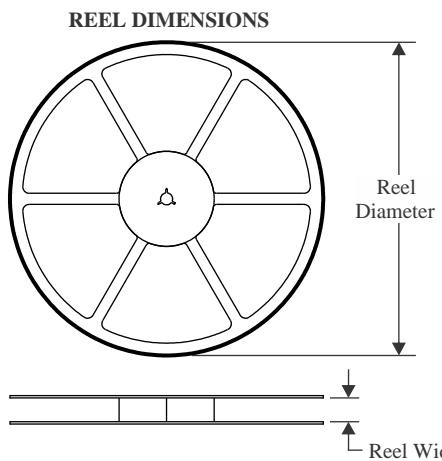

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

# PACKAGE OUTLINE

DCK0006A

SOT - 1.1 max height

SMALL OUTLINE TRANSISTOR

4214835/D 11/2024

## NOTES:

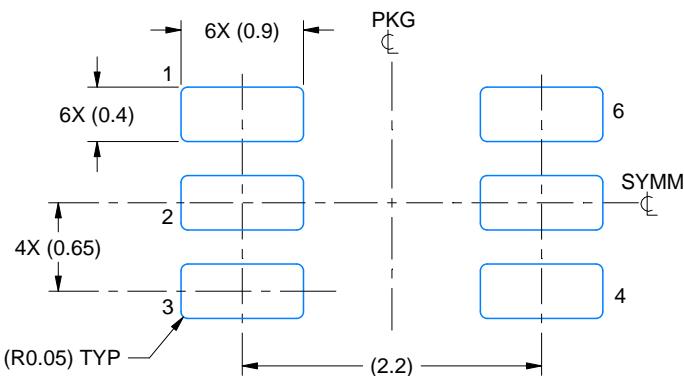

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
4. Falls within JEDEC MO-203 variation AB.
