

TPS3703 具有延时时间和手动复位功能的高精度过压和欠压复位 IC

1 特性

- 输入电压范围：1.7V 至 5.5V
- 欠压锁定 (UVLO)：1.7V
- 低静态电流：7 μ A (最大值)
- 高阈值精度：
 - $\pm 0.25\%$ (典型值)
 - $\pm 0.7\%$ (-40°C 至 +125°C)
- 固定窗口阈值电平
 - 50mV 阶跃 (500mV 至 1.3V)
 - 1.5V、1.8V、2.5V、2.8V、2.9V、3.3V、5V
 - 仅使用 UV 阈值
 - 窗口公差范围为 $\pm 3\%$ 至 $\pm 7\%$
- 用户可调的电压阈值电平
- 内部毛刺抑制和迟滞
- 固定延时时间选项：50 μ s、1ms、5ms、10ms、20ms、100ms、200ms
- 使用单个外部电容器的可编程延时时间选项
- 漏极开路低电平有效 UV 和 OV 监控器
- $\overline{\text{RESET}}$ 电压锁存输出模式

2 应用

- 电机驱动器
- 工厂自动化和控制
- 家庭影院和娱乐系统
- 电网基础设施
- 数据中心和企业级计算

集成式过压和欠压检测

3 说明

TPS3703 器件是一款集成式过压 (OV) 和欠压 (UV) 监控器或复位 IC，采用业界超小的 6 引脚 DSE 封装。这款高精度的电压监控器非常适合采用低电压电源轨的系统，并具有非常小的电源容差裕度。低阈值迟滞可防止在受监控的电压处于正常工作范围内时发出虚假复位信号。并且内置有毛刺抑制功能和噪声滤波器，进一步消除了错误信号所导致的错误复位。

TPS3703 不需要使用任何外部电阻器来设置过压和欠压复位阈值，因此进一步优化了整体精度、成本、解决方案大小并提高了安全系统的可靠性。电容器时间 (CT) 引脚用于在每个器件的两个可用复位延时时间之间进行选择，还可以连接一个电容器以调整复位延时时间。单独的 SENSE 输入引脚和 VDD 引脚可实现高可靠性系统所需的冗余。

此器件的低典型静态电流规格为 4.5 μ A (典型值)。TPS3703 适用于工业应用和需要精确欠压和过压监控的应用。

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	SENSE	I	Input for the monitored supply voltage rail. When the SENSE voltage goes above the overvoltage threshold or below the undervoltage threshold, the RESET pin is driven low. Connect to VDD pin if monitoring VDD supply voltage.
2	VDD	I	Supply voltage input pin. Good analog design practice is to place a 0.1- μ F ceramic capacitor close to this pin.
3	CT	I	Capacitor time delay pin. The CT pin offers two fixed time delays by connecting CT pin to VDD or leaving it floating. Delay time can be programmed by connecting an external capacitor reference to ground.
4	RESET	O	Active-low, open-drain output. This pin goes low when the SENSE voltage rises above the internally overvoltage threshold (V_{IT+}) or below the undervoltage threshold (V_{IT-}). See the timing diagram in 图 8-2 for more details. Connect this pin to a pull-up resistor terminated to the desired pull-up voltage.
5	GND	—	Ground
6	MR	I	Manual reset (MR), pull this pin to a logic low (V_{MR_L}) to assert a reset signal . After the MR pin is deasserted the output goes high after the reset delay time(t_D) expires. MR can be left floating when not in use.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage	V _{DD}	- 0.3	6	V
Voltage	V _{RESET}	- 0.3	6	V
Voltage	V _{CT}	- 0.3	6	V
Voltage	V _{SENSE}	- 0.3	6	V
Voltage	V _{MR}	- 0.3	6	V
Current	I _{RESET}		±40	mA
Temperature ⁽²⁾	Continuous total power dissipation	See the Thermal Information		
	Operating junction temperature, T _J	-40	150	°C
	Operating free-air temperature, T _A	-40	150	°C
	Storage temperature, T _{stg}	-65	150	°C

- (1) Stresses beyond values listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) As a result of the low dissipated power in this device, it is assumed that T_J = T_A.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽²⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽¹⁾	±750	

- (1) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V _{DD}	Supply pin voltage	1.7		5.5	V
V _{SENSE}	Input pin voltage	0		5.5	V
V _{CT}	CT pin voltage ⁽¹⁾ ⁽³⁾			V _{DD}	V
V _{RESET}	Output pin voltage	0		5.5	V
V _{MR}	MR pin Voltage ⁽²⁾	0		5.5	V
I _{RESET}	Output pin current	0.3		10	mA
T _J	Junction temperature (free-air temperature)	-40		125	°C

- (1) CT pin connected to VDD pin requires a pullup resistor; 10 kΩ is recommended.
- (2) If the logic signal driving MR is less than V_{DD}, then additional current flows into V_{DD} and out of MR.
- (3) The maximum rating is V_{DD} or 5.5 V, whichever is smaller.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS3703	UNIT
		DSE (WSON)	
		PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	184.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	30.6	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	86.4	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	13.4	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	86.1	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics

At $1.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $CT = \overline{MR} = \text{Open}$, $\overline{\text{RESET}}$ Voltage (V_{RESET}) = $10\text{ k}\Omega$ to V_{DD} , $\overline{\text{RESET}}$ load = 10 pF , and over the operating free-air temperature range of -40°C to 125°C , unless otherwise noted. Typical values are at $T_J = 25^\circ\text{C}$, typical conditions at $V_{DD} = 3.3\text{ V}$.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{DD}	Supply Voltage		1.7		5.5	V
UVLO	Under Voltage Lockout ⁽³⁾	V_{DD} falling below 1.7 V	1.2		1.7	V
V_{POR}	Power on reset voltage ⁽²⁾	$V_{OL(max)} = 0.25\text{ V}$, $I_{OUT} = 15\text{ }\mu\text{A}$			1	V
$V_{IT+(OV)}$	Positive-going threshold accuracy		-0.7	± 0.25	0.7	%
$V_{IT-(UV)}$	Negative-going threshold accuracy		-0.7	± 0.25	0.7	%
V_{HYS}	Hysteresis Voltage ⁽¹⁾		0.3	0.55	0.8	%
$V_{IT+(OV)}$	Positive-going threshold accuracy	$V_{IT} < 800\text{ mV}$	-1		1	%
$V_{IT-(UV)}$	Negative-going threshold accuracy	$V_{IT} < 800\text{ mV}$	-1		1	%
V_{HYS}	Hysteresis Voltage ⁽¹⁾	$V_{IT} < 800\text{ mV}$	0.2		0.7	%
I_{DD}	Supply current	$V_{DD} \leq 5.5\text{ V}$		4.5	7	μA
I_{SENSE}	Input current, SENSE pin	$V_{SENSE} = 5\text{ V}$		1	1.5	μA
V_{OL}	Low level output voltage	$V_{DD} = 1.7\text{ V}$, $I_{OUT} = 0.4\text{ mA}$			250	mV
		$V_{DD} = 2\text{ V}$, $I_{OUT} = 3\text{ mA}$			250	mV
		$V_{DD} = 5\text{ V}$, $I_{OUT} = 5\text{ mA}$			250	mV
I_{LKG}	Open drain output leakage current	$V_{DD} = V_{\text{RESET}} = 5.5\text{ V}$			300	nA
V_{MR_L}	MR logic low input				0.3	V
V_{MR_H}	MR logic high input		1.4			V
V_{CT_H}	High level CT pin voltage		1.4			V
R_{MR}	Manual reset Internal pullup resistance			100		$\text{K}\Omega$
I_{CT}	CT pin charge current		337	375	413	nA
V_{CT}	CT pin comparator threshold voltage ⁽⁴⁾		1.133	1.15	1.167	V

- (1) Hysteresis is with respect of the tripoint ($V_{IT-(UV)}$, $V_{IT+(OV)}$).
 (2) V_{POR} is the minimum V_{DD} voltage level for a controlled output state.
 (3) RESET pin is driven low when V_{DD} falls below UVLO.
 (4) V_{CT} voltage refers to the comparator threshold voltage that measures the voltage level of the external capacitor at CT pin.

7.6 Timing Requirements

At $1.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $CT = \overline{MR} = \text{Open}$, $\overline{RESET}$ Voltage (V_{RESET}) = $10\text{ k}\Omega$ to V_{DD} , $\overline{RESET}$ load = 10 pF , and over the operating free-air temperature range of -40°C to 125°C , unless otherwise noted. Typical values are at $T_J = 25^\circ\text{C}$, typical conditions at $V_{DD} = 3.3\text{ V}$.

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
t_D	Reset time delay, TPS3703A, TPS3703E	$CT = \text{Open}$	7	10	13	ms
t_D	Reset time delay, TPS3703A, TPS3703E	$CT = 10\text{ k}\Omega$ to V_{DD}	140	200	260	ms
t_D	Reset time delay, TPS3703B, TPS3703F	$CT = \text{Open}$	0.7	1	1.3	ms
t_D	Reset time delay, TPS3703B, TPS3703F	$CT = 10\text{ k}\Omega$ to V_{DD}	14	20	26	ms
t_D	Reset time delay, TPS3703C, TPS3703G	$CT = \text{Open}$	3.5	5	6.5	ms
t_D	Reset time delay, TPS3703C, TPS3703G	$CT = 10\text{ k}\Omega$ to V_{DD}	70	100	130	ms
t_D	Reset time delay, TPS3703D, TPS3703H	$CT = 10\text{ k}\Omega$ to V_{DD} $CT = \text{Open}$		50		μs
t_{PD}	Propagation detect delay ^{(1) (2)}			15	30	μs
t_R	Output rise time ^{(1) (3)}			2.2		μs
t_F	Output fall time ^{(1) (3)}			0.2		μs
t_{SD}	Startup delay ⁽⁴⁾			300		μs
$t_{GI} (V_{IT-})$	Glitch Immunity undervoltage $V_{IT-(UV)}$, 5% Overdrive ⁽¹⁾			3.5		μs
$t_{GI} (V_{IT+})$	Glitch Immunity overvoltage $V_{IT+(OV)}$, 5% Overdrive ⁽¹⁾			3.5		μs
$t_{GI} (\overline{MR})$	Glitch Immunity $\overline{MR}$ pin				25	ns
$t_{PD} (\overline{MR})$	Propagation delay from $\overline{MR}$ low to assert $\overline{RESET}$			500		ns
t_{MR_W}	$\overline{MR}$ pin pulse width duration to assert $\overline{RESET}$		1			μs
$t_D (\overline{MR})$	$\overline{MR}$ reset time delay			t_D		ms

(1) 5% Overdrive from threshold. Overdrive % = $[V_{SENSE} - V_{IT}] / V_{IT}$; Where V_{IT} stands for $V_{IT-(UV)}$ or $V_{IT+(OV)}$

(2) t_{PD} measured from threshold trip point ($V_{IT-(UV)}$ or $V_{IT+(OV)}$) to $\overline{RESET}$ V_{OL} voltage

(3) Output transitions from V_{OL} to 90% for rise times and 90% to V_{OL} for fall times.

(4) During the power-on sequence, V_{DD} must be at or above $V_{DD(MIN)}$ for at least $t_{SD} + t_D$ before the output is in the correct state.

8 Detailed Description

8.1 Overview

The TPS3703 family of devices combines two voltage comparators and a precision voltage reference for overvoltage and undervoltage detection. The TPS3703 features a highly accurate window threshold voltages ($\pm 0.7\%$ over temperature) and a variety voltage threshold variants.

The TPS3703 includes the resistors used to set the overvoltage and undervoltage thresholds internal to the device. These internal resistors allow for lower component counts and greatly simplifies the design because no additional margins are needed to account for the accuracy of external resistors.

TPS3703 version A, B and C has three time delay settings, two fixed by connecting CT pin to VDD through a resistor and leaving CT floating and a programmable time delay setting that only requires a single capacitor connected from CT pin to ground.

Manual Reset ($\overline{\text{MR}}$) allows for sequencing or hard reset by driving the $\overline{\text{MR}}$ pin below $V_{\text{MR_L}}$.

The TPS3703 is designed to assert active low output signals when the monitored voltage is outside the safe window. The relationship between the monitored voltage and the states of the outputs is shown in 表 8-1.

8.2 Functional Block Diagram

*For all possible voltages, window tolerance, time delays, and UV threshold options, see 表 12-1.

8.3 Feature Description

8.3.1 VDD

The TPS3703 is designed to operate from an input voltage supply range between 1.7 V to 5.5 V. An input supply capacitor is not required for this device; however, if the input supply is noisy good analog practice is to place a 1- μF capacitor between the VDD pin and the GND pin.

V_{DD} needs to be at or above $V_{\text{DD(MIN)}}$ for at least the start-up delay ($t_{\text{SD}} + t_{\text{D}}$) for the device to be fully functional.

8.3.2 SENSE

The TPS3703 combines two comparators with a precision reference voltage and a trimmed resistor divider. This configuration optimizes device accuracy because all resistor tolerances are accounted for in the accuracy and performance specifications. Both comparators also include built-in hysteresis that provides noise immunity and ensures stable operation.

Although not required in most cases, for noisy applications good analog design practice is to place a 1-nF to 10-nF bypass capacitor at the SENSE input in order to reduce sensitivity to transient voltages on the monitored signal.

When monitoring VDD supply voltage, the SENSE pin can be connected directly to VDD. The output ($\overline{\text{RESET}}$) is high impedance when voltage at the SENSE pin is between upper and lower boundary of threshold.

8.3.3 RESET

In a typical TPS3703 application, the $\overline{\text{RESET}}$ output is connected to a reset or enable input of a processor [such as a digital signal processor (DSP), application-specific integrated circuit (ASIC), or other processor type] or the enable input of a voltage regulator [such as a DC-DC converter or low-dropout regulator (LDO)].

The TPS3703 has an open drain active low output that requires a pull-up resistor to hold these lines high to the required voltage logic. Connect the pull-up resistor to the proper voltage rail to enable the output to be connected to other devices at the correct interface voltage levels. To ensure proper voltage levels, give some consideration when choosing the pull-up resistor values. The pull-up resistor value is determined by V_{OL} , output capacitive loading, and output leakage current. These values are specified in 节 7.5. The open drain output can be connected as a wired-OR logic with other open drain signals such as another TPS3703 $\overline{\text{RESET}}$ pin.

表 8-1 describes the scenarios when the output ($\overline{\text{RESET}}$) is either asserted low or high impedance.

图 8-1. RESET output

8.3.4 Capacitor Time (CT)

The CT pin provides the user the functionality of both high-precision, factory-programmed, reset delay timing options and user-programmable, reset delay timing. The CT pin can be pulled up to V_{DD} through a resistor, have an external capacitor to ground, or can be left unconnected. The configuration of the CT pin is re-evaluated by the device every time the voltage on the SENSE line enters the valid window ($V_{IT-(UV)} < V_{SENSE} < V_{IT+(OV)}$). The pin evaluation is controlled by an internal state machine that determines which option is connected to the CT pin. The sequence of events takes 450 μs to determine if the CT pin is left unconnected, pulled up through a resistor, or connected to a capacitor. If the CT pin is being pulled up to V_{DD} , then a pull-up resistor is required, 10 k Ω is recommended.

8.3.5 Manual Reset ($\overline{\text{MR}}$)

The manual reset ($\overline{\text{MR}}$) input allows a processor or other logic circuits to initiate a reset. A logic low on $\overline{\text{MR}}$ causes $\overline{\text{RESET}}$ to assert. After $\overline{\text{MR}}$ returns to a logic high and the SENSE pin voltage is within a valid window ($V_{\text{IT-(UV)}} < V_{\text{SENSE}} < V_{\text{IT+(OV)}}$), $\overline{\text{RESET}}$ is deasserted after the reset delay time (t_D). If $\overline{\text{MR}}$ is not controlled externally, then $\overline{\text{MR}}$ can either be connected to V_{DD} or left floating because the $\overline{\text{MR}}$ pin is internally pulled up to V_{DD} . 图 8-2 shows the relation between $\overline{\text{MR}}$ and $\overline{\text{RESET}}$.

- $\overline{\text{RESET}}$ pulls up to V_{DD} with 10 k Ω .
- To initiate and continue time reset counter both conditions must be met $\overline{\text{MR}}$ pin above $V_{\text{MR_H}}$ or floating and V_{SENSE} between $V_{\text{IT-(UV)}} + V_{\text{HYS}}$ and $V_{\text{IT+(OV)}} - V_{\text{HYS}}$
- $\overline{\text{MR}}$ is ignored during output $\overline{\text{RESET}}$ low event

图 8-2. Manual Reset Timing Diagram

8.4 Device Functional Modes

表 8-1. Functional Mode Truth Table

DESCRIPTION	CONDITION	MR PIN	VDD PIN	OUTPUT (RESET PIN)
Normal Operation	$V_{IT-(UV)} < SENSE < V_{IT+(OV)}$	Open or above V_{MR_H}	$V_{DD} > V_{DD(MIN)}$	High
Normal Operation (UV Only)	$SENSE > V_{IT-(UV)}$	Open or above V_{MR_H}	$V_{DD} > V_{DD(MIN)}$	High
Over Voltage detection	$SENSE > V_{IT+(OV)}$	Open or above V_{MR_H}	$V_{DD} > V_{DD(MIN)}$	Low
Under Voltage detection	$SENSE < V_{IT-(UV)}$	Open or above V_{MR_H}	$V_{DD} > V_{DD(MIN)}$	Low
Manual reset	$V_{IT-(UV)} < SENSE < V_{IT+(OV)}$	Below V_{MR_L}	$V_{DD} > V_{DD(MIN)}$	Low
UVLO engaged	$V_{IT-(UV)} < SENSE < V_{IT+(OV)}$	Open or above V_{MR_H}	$V_{POR} < V_{DD} < UVLO$	Low

8.4.1 Normal Operation ($V_{DD} > V_{DD(MIN)}$)

When the voltage on V_{DD} is greater than $V_{DD(MIN)}$ for approximately ($t_{SD} + t_D$), the $\overline{RESET}$ output state will correspond to the SENSE pin voltage with respect to the threshold limits, when SENSE voltage is outside of threshold limits the $\overline{RESET}$ voltage will be low (V_{OL}).

8.4.2 Undervoltage Lockout ($V_{POR} < V_{DD} < UVLO$)

When the voltage on V_{DD} is less than the device UVLO voltage but greater than the power-on reset voltage (V_{POR}), the $\overline{RESET}$ pin will be held low, regardless of the voltage on SENSE pin.

8.4.3 Power-On Reset ($V_{DD} < V_{POR}$)

When the voltage on V_{DD} is lower than the required voltage (V_{POR}) to internally pull the asserted output to GND, $\overline{RESET}$ signal is undefined and is not to be relied upon for proper device function.

9 Application and Implementation

备注

以下应用部分的信息不属于 TI 组件规范，TI 不担保其准确性和完整性。客户应负责确定 TI 组件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

9.1 Application Information

9.1.1 Voltage Threshold Accuracy

Voltage monitoring requirements vary depending on the voltage supply tolerance of the device being powered. Due to the high precision of the TPS3703 ($\pm 0.7\%$ Max), the device allows for a wider supply voltage margins and threshold headroom for tight tolerance applications.

For example, take a DC/DC regulator providing power to a core voltage rail of an MCU. The MCU has a tolerance of $\pm 5\%$ of the nominal output voltage of the DC/DC. The user sets an ideal voltage threshold of $\pm 4\%$ which allows for $\pm 1\%$ of threshold accuracy. Since the TPS3703 threshold accuracy is higher than $\pm 1\%$, the user has more supply voltage margin which can allow for a relaxed power supply design. This gives flexibility to the DC/DC to use a smaller output capacitor or inductor because of a larger voltage window for voltage ripple and transients. There is also headroom between the minimum system voltage and voltage tolerance of the MCU to ensure that the voltage supply will never be in the region of potential failure of malfunction without the TPS3703 asserting a reset signal.

图 9-1 illustrates the supply undervoltage margin and accuracy of the TPS3703 for the example explained above. Using a low accuracy supervisor will eat into the available budget for the power supply ripple and transient response. This gives less flexibility to the user and a more stringent DC/DC converter design.

图 9-1. TPS3703 Voltage Threshold Accuracy

9.1.2 CT Reset Time Delay

The TPS3703 features three options for setting the reset delay (t_D): connecting a capacitor to the CT pin, connecting a pull-up resistor to VDD, and leaving the CT pin unconnected. 图 9-2 shows a schematic drawing of all three options. To determine which option is connected to the CT pin, an internal state machine controls the internal pulldown device and measures the pin voltage. This sequence of events takes 450 μ s to determine which timing option is used. Every time the voltage on the SENSE line enters the valid window ($V_{IT-(UV)} + V_{HYS} < V_{SENSE} < V_{IT+(OV)} - V_{HYS}$), the state machine determines the CT option.

图 9-2. CT Charging Circuit

9.1.2.1 Factory-Programmed Reset Delay Timing

To use the factory-programmed timing options, the CT pin must either be left unconnected or pulled up to VDD through a 10 k Ω pull-up resistor. Using these options enables a high-precision reset delay timing, as shown in 表 9-1.

表 9-1. Reset Delay Time for Factory-Programmed Reset Delay Timing

VARIANT	RESET DELAY TIME (t_D)			VALUE
	CT = Capacitor to GND	CT = Floating	CT = 10 k Ω to VDD	
TPS3703A	Programmable t_D	10	200	ms
TPS3703B	Programmable t_D	1	20	ms
TPS3703C	Programmable t_D	5	100	ms
TPS3703D	N/A	50	50	μ s

9.1.2.2 Programmable Reset Delay-Timing

The TPS3703 reset time delay is based on internal current source (I_{CT}) to charge external capacitor (C_{CT}) and read capacitor voltage with internal comparator. The minimum value capacitor is 250 pF. There is no limitation on maximum capacitor the only constrain is imposed by the initial voltage of the capacitor, if CT cap is zero or near to zero then ideally there is no other constraint on the max capacitor. The typical ideal capacitor value needed for a given delay time can be calculated using 方程式 1, where C_{CT} is in nanofarads (nF) and t_D is in ms:

$$t_D = 3.066 \times C_{CT} + 0.5 \text{ ms} \quad (1)$$

To calculate the minimum and maximum-reset delay time use 方程式 2 and 方程式 3, respectively.

$$t_{D(\min)} = 2.7427 \times C_{CT} + 0.3 \text{ ms} \quad (2)$$

$$t_{D(max)} = 3.4636 \times C_{CT} + 0.7 \text{ ms} \quad (3)$$

The slope of the equation is determined by the time the CT charging current (I_{CT}) takes to charge the external capacitor up to the CT comparator threshold voltage (V_{CT}). When $\overline{\text{RESET}}$ is asserted, the capacitor is discharged through the internal CT pulldown resistor. When the $\overline{\text{RESET}}$ conditions are cleared, the internal precision current source is enabled and begins to charge the external capacitor; when $V_{CT} = 1.15 \text{ V}$, $\overline{\text{RESET}}$ is unasserted. Note that in order to minimize the difference between the calculated $\overline{\text{RESET}}$ delay time and the actual $\overline{\text{RESET}}$ delay time, use a high-quality ceramic dielectric COG, X5R, or X7R capacitor and minimize parasitic board capacitance around this pin. 表 9-2 lists the reset delay time ideal capacitor values for C_{CT} .

表 9-2. Reset Delay Time for Ideal Capacitor Values

C_{CT}	RESET DELAY TIME (t_D), TYPICAL
250 pF	1.27 ms
1 nF	3.57 ms
3.26 nF	10.5 ms
32.6 nF	100.45 ms
65.2 nF	200.40 ms
1 μF	3066.50 ms

9.1.3 RESET Latch Mode

The TPS3703 features a voltage latch mode on the $\overline{\text{RESET}}$ pin when connecting the CT pin to common ground. A pull-down resistor is recommended to limit current consumption of the system. In latch mode, if the $\overline{\text{RESET}}$ pin is low or triggers low, the pin will stay low regardless if V_{SENSE} is within the acceptable voltage boundaries ($V_{IT-(UV)} < V_{\text{SENSE}} < V_{IT+(OV)}$). To unlatch the device provide a voltage to the CT pin that is greater than the CT pin comparator threshold voltage, V_{CT} . The $\overline{\text{RESET}}$ pin will trigger high instantaneously without any reset delay. A voltage greater than 1.2 V is recommended to ensure a proper unlatch. Use a series resistance to limit current when an unlatch voltage is applied. For more information, 节 9.2.2 gives an example of a typical latch application.

图 9-3. RESET Latch Circuit

9.1.4 Adjustable Voltage Thresholds

The TPS3703 0.7% maximum accuracy allows for adjustable voltage thresholds using external resistors without adding major inaccuracies to the device. In case that the desired monitored voltage is not available, external resistor dividers can be used to set the desired voltage thresholds. 图 9-4 illustrates an example of how to adjust the voltage threshold with external resistor dividers. The resistors can be calculated depending on the desired voltage threshold and device part number. TI recommends using the 0.8V voltage threshold device such as the TPS3703B3080 because of the bypass mode of internal resistor ladder.

For example, consider a 2.0 V rail being monitored (V_{MON}) using the TPS3703B3080 variant. Using 方程式 4, $R_1 = 15\text{ k}\Omega$ given that $R_2 = 10\text{ k}\Omega$, $V_{MON} = 2\text{ V}$, and $V_{SENSE} = 0.8\text{ V}$. This device is typically meant to monitor a 0.8 V rail with $\pm 3\%$ voltage thresholds. This means that the device undervoltage threshold ($V_{IT-(UV)}$) and overvoltage threshold ($V_{IT-(OV)}$) is 0.776 V and 0.824 V respectively. Using 方程式 4, $V_{MON} = 1.94\text{ V}$ when $V_{SENSE} = V_{IT-(UV)}$. This can be denoted as V_{MON-} , the monitored undervoltage threshold where the device will assert a reset signal. Using 方程式 4 again, the monitored overvoltage threshold (V_{MON+}) = 2.06 V when $V_{SENSE} = V_{IT+(OV)}$. If a wider tolerance or UV only threshold is desired, use a device variant shown on 表 12-1 to determine what device part number matches your application.

$$V_{SENSE} = V_{MON} \times (R_2 \div (R_1 + R_2)) \quad (4)$$

There are inaccuracies that must be taken into consideration while adjusting voltage thresholds. Aside from the tolerance of the resistor divider, there is an internal resistance of the SENSE pin that may affect the accuracy of the resistor divider. Although expected to be very high impedance, users are recommended to calculate the values for design specifications. The internal sense resistance (R_{SENSE}) can be calculated by the sense voltage (V_{SENSE}) divided by the sense current (I_{SENSE}) as shown in 方程式 6. V_{SENSE} can be calculated using 方程式 4 depending on the resistor divider and monitored voltage. I_{SENSE} can be calculated using 方程式 5.

$$I_{SENSE} = (V_{MON} - V_{SENSE}) \div R_1 - (V_{SENSE} \div R_2) \quad (5)$$

$$R_{SENSE} = V_{SENSE} \div I_{SENSE} \quad (6)$$

图 9-4. Adjustable Voltage Threshold with External Resistor Dividers

9.1.5 Immunity to SENSE Pin Voltage Transients

The TPS3703 is immune to short voltage transient spikes on the input pins. Sensitivity to transients depends on both transient duration and overdrive (amplitude) of the transient.

Overdrive is defined by how much the V_{SENSE} exceeds the specified threshold, and is important to know because the smaller the overdrive, the slower the response of the outputs ($\overline{\text{RESET}}$). Threshold overdrive is calculated as a percent of the threshold in question, as shown in 方程式 7:

$$\text{Overdrive \%} = | (V_{\text{SENSE}} - (V_{\text{IT-(UV)}} \text{ or } V_{\text{IT+(OV)}})) / V_{\text{IT (Nominal)}} \times 100\% | \quad (7)$$

where:

- V_{SENSE} is the voltage at the SENSE pin
- $V_{\text{IT (Nominal)}}$ is the nominal threshold voltage
- $V_{\text{IT-(UV)}}$ and $V_{\text{IT+(OV)}}$ represent the actual undervoltage or overvoltage tripping voltage

9.1.5.1 Hysteresis

Overvoltage and undervoltage comparators include built-in hysteresis that provides noise immunity and ensures stable operation. For example if the voltage on the SENSE pin falls below $V_{\text{IT-(UV)}}$ or above $V_{\text{IT+(OV)}}$, then $\overline{\text{RESET}}$ is asserted (driven low), then when the voltage on the SENSE pin is between the positive and negative threshold voltages, $\overline{\text{RESET}}$ deasserts after the user-defined $\overline{\text{RESET}}$ delay time. 图 9-5 shows the relation between $V_{\text{IT-(UV)}}$, $V_{\text{IT+(OV)}}$ and hysteresis voltage (V_{HYS}).

图 9-5. SENSE Pin Hysteresis

9.2 Typical Application

9.2.1 Design 1: Multi-Rail Window Monitoring for Microcontroller Power Rails

A typical application for the TPS3703 is shown in 图 9-6. The TPS3703 is used to monitor two PMIC voltage rails that powers the core and I/O voltage of the microcontroller that requires accurate reset delay and voltage supervision. It utilizes the TPS3703 to monitor the core voltage rail of a MCU similar to the circuit below.

图 9-6. Two TPS3703 Monitoring Two Microcontroller Power Rails

9.2.1.1 Design Requirements

表 9-3. Design Parameters

PARAMETER	DESIGN REQUIREMENT	DESIGN RESULT
Monitored rails	3.3-V _{I/O} nominal, with alerts if outside of ±8% of 3.3 V (including device accuracy), 200 ms reset delay	Worst case V _{IT+(OV)} = 3.554 V (7.7%), Worst case V _{IT-(UV)} = 3.046 V (-7.7%)
	1.2-V _{CORE} nominal, with alerts if outside of ±5% of 1.2 V (including device accuracy), 10 ms reset delay	Worst case V _{IT+(OV)} = 1.256 V (4.7%), Worst case V _{IT-(UV)} = 1.144 V (-4.7%)
Output logic voltage	5-V CMOS	5-V CMOS
Maximum system supervision current consumption	50 μA	14 μA (7 μA Max each)

9.2.1.2 Detailed Design Procedure

Determine which version of the TPS3703 best suits the monitored rail (V_{MON}) and window tolerances found on 表 12-1. The TPS3703 allows overvoltage and undervoltage monitoring for precise voltage supervision of common rails between 0.5 V and 5.0 V. This application calls for very tight monitoring of the rail with only ±5% of variation allowed on the 1.2V core rail. To ensure this requirement is met, the TPS3703 was chosen for its ±4% thresholds. The 3.3V I/O is more flexible and can operate up to 8% variance. Since the TPS3703 comes in various tolerance options, the ±7% thresholds can be chosen for this voltage rail. To calculate the worst-case for V_{IT+(OV)} and V_{IT-(UV)}, the accuracy must also be taken into account. The worst-case for V_{IT+(OV)} and V_{IT-(UV)} can be calculated shown in 方程式 8 and 方程式 9 respectively:

$$V_{IT+(OV-Worst\ Case)} = V_{MON} \times (\%Threshold + 0.7\%) = 1.2 \times (+4.7\%) = 1.256\ V \quad (8)$$

$$V_{IT-(UV-Worst\ Case)} = V_{MON} \times (\%Threshold - 0.7\%) = 1.2 \times (-4.7\%) = 1.144\ V \quad (9)$$

When the outputs switch to a high impedance state, the rise time of the RESET pin depends on the pull-up resistance and the capacitance on that node. Choose pull-up resistors that satisfy both the downstream timing requirements and the sink current required to have a V_{OL} low enough for the application; 10 kΩ to 1 MΩ resistors are a good choice for low-capacitive loads.

9.2.1.3 Application Curves

V_{SENSE} Start up from 0 V to 1.2 V, $V_{DD} = 3.3$ V, CT = OPEN
 $V_{RESET} = V_{DD} = 3.3$ V, TPS3703A4120

图 9-7. TPS3703 SENSE Start Up Function

V_{DD} Start up from 0 V to 3.3 V, $V_{SENSE} = 1.2$ V, CT = OPEN
 $V_{RESET} = V_{DD} = 3.3$ V, TPS3703A4120

图 9-8. TPS3703 VDD Start Up Function

V_{SENSE} ramp from 0 V to 1.4 V, $V_{DD} = 3.3$ V, CT = OPEN
 $V_{RESET} = V_{DD} = 3.3$ V, TPS3703A4120

图 9-9. TPS3703 Overvoltage and Undervoltage Function

V_{DD} ramp from 0 V to 3.3 V, $V_{SENSE} = 1.2$ V, CT = OPEN
 $V_{RESET} = V_{DD} = 3.3$ V, TPS3703A4120

图 9-10. TPS3703 VDD Ramp Up Function

9.2.2 Design 2: $\overline{\text{RESET}}$ Latch Mode

Another typical application for the TPS3703 is shown in 图 9-11. The TPS3703 is used in a $\overline{\text{RESET}}$ latch output mode. In latch mode, once $\overline{\text{RESET}}$ driven logic low, it will stay low regardless of the sense voltage. If the $\overline{\text{RESET}}$ pin is low on start up, it will also stay low regardless of sense voltage.

图 9-11. Window Voltage Monitoring with $\overline{\text{RESET}}$ Latch

9.2.2.1 Design Requirements

表 9-4. Design Parameters

PARAMETER	DESIGN REQUIREMENT	DESIGN RESULT
Monitored Rail	1.2- V_{CORE} nominal, with alerts if outside of $\pm 5\%$ of 1.2 V (including device accuracy), Latch when $\overline{\text{RESET}}$ is low, until voltage is applied on CT pin.	Worst case $V_{\text{IT}+(\text{OV})} = 1.256 \text{ V}$ (4.7%), Worst case $V_{\text{IT}-(\text{UV})} = 1.144 \text{ V}$ (-4.7%)
Output logic voltage	5-V CMOS	5-V CMOS
Maximum device current consumption	15 μA	4.5 μA (Typ), 7 μA (Max)

9.2.2.2 Detailed Design Procedure

The $\overline{\text{RESET}}$ pin can be latched when the CT pin is connected to a common ground with a pull-down resistor. A 10 k Ω resistors is recommended to limit current consumption. To unlatch the device provide a voltage to the CT pin that is greater than the CT pin comparator threshold voltage, V_{CT} . A voltage greater than 1.15 V to recommended to ensure a proper unlatch. Use a series resistance to limit current when an unlatch voltage is applied. To go back into latch operation, disconnect the voltage on the CT pin. The $\overline{\text{RESET}}$ pin will trigger high instantly without any reset delay.

9.2.2.3 Application Curves

V_{SENSE} ramp from 0 V to 1.4V, $V_{DD} = 3.3$ V, $V_{CT} = 0$ V
 $V_{RESET} = V_{DD} = 3.3$ V, TPS3703A4120

图 9-15. TPS3703 VDD Ramp Latch Function

10 Power Supply Recommendations

10.1 Power Supply Guidelines

This device is designed to operate from an input supply with a voltage range between 1.7 V to 5.5 V. It has a 6-V absolute maximum rating on the VDD pin. It is good analog practice to place a 0.1- μ F to 1- μ F capacitor between the VDD pin and the GND pin depending on the input voltage supply noise. If the voltage supply providing power to VDD is susceptible to any large voltage transient that exceed maximum specifications, additional precautions must be taken. See [SNVA849](#) for more information.

11 Layout

11.1 Layout Guidelines

- Place the external components as close to the device as possible. This configuration prevents parasitic errors from occurring.
- Avoid using long traces for the VDD supply node. The VDD capacitor, along with parasitic inductance from the supply to the capacitor, can form an LC circuit and create ringing with peak voltages above the maximum VDD voltage.
- Avoid using long traces of voltage to the sense pin. Long traces increase parasitic inductance and cause inaccurate monitoring and diagnostics.
- Do not run sensitive analog traces in parallel with digital traces. Avoid crossing digital and analog traces if possible, and only make perpendicular crossings when absolutely necessary.

11.2 Layout Example

12.6 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

12.7 术语表

[TI 术语表](#) 本术语表列出并解释了术语、首字母缩略词和定义。

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

OTHER QUALIFIED VERSIONS OF TPS3703 :

- Automotive : [TPS3703-Q1](#)

NOTE: Qualified Version Definitions:

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

PACKAGE OUTLINE

WSON - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

4220552/B 01/2024

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.

EXAMPLE BOARD LAYOUT

DSE0006A

WSN - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

LAND PATTERN EXAMPLE
SCALE:40X

SOLDER MASK DETAILS

4220552/B 01/2024

NOTES: (continued)

3. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).

EXAMPLE STENCIL DESIGN

DSE0006A

WSON - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:40X

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

重要通知和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他功能安全、信息安全、监管或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的相关应用。严禁以其他方式对这些资源进行复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。您应全额赔偿因在这些资源的使用中对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，TI 对此概不负责。

TI 提供的产品受 [TI 的销售条款](#) 或 [ti.com](#) 上其他适用条款/TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。

TI 反对并拒绝您可能提出的任何其他或不同的条款。
