Description

The Si552 dual-frequency VCXO utilizes Skyworks Solutions' advanced DSPLL$^®$ circuitry to provide a very low jitter clock for all output frequencies. The Si552 is available with any-rate output frequency from 10 to 945 MHz and selected frequencies to 1400 MHz. Unlike traditional VCXOs, where a different crystal is required for each output frequency, the Si552 uses one fixed crystal frequency to provide a wide range of output frequencies. This IC-based approach allows the crystal resonator to provide exceptional frequency stability and reliability. In addition, DSPLL clock synthesis provides superior supply noise rejection, simplifying the task of generating low-jitter clocks in noisy environments typically found in communication systems. The Si552 IC-based VCXO is factory-configurable for a wide variety of user specifications including frequency, supply voltage, output format, tuning slope, and temperature stability. Specific configurations are factory programmed at time of shipment, thereby eliminating the long lead times associated with custom oscillators.

6-digit Frequency Designator Code
Two unique frequencies can be specified within the following bands of frequencies : 10 to 945 MHz, 970 to 1134 MHz, and 1213 to 1417 MHz. A six digit code will be assigned for the specified combination of frequencies. Codes > 000100 refer to dual XOs programmed with the lower frequency value selected when FS = 0, and the higher value when FS = 1. Six digit codes < 000100 refer to dual XOs programmed with the higher frequency value selected when FS = 0, and the lower value when FS = 1.

A	3.3	LVPECL
B	3.3	LVDS
C	3.3	CMOS
D	3.3	CML
E	2.5	LVPECL
F	2.5	LVDS
G	2.5	CMOS
H	2.5	CML
J	1.8	CMOS
K	1.8	CML

Notes:
CMOS available to 160 MHz.

2nd Option Code

Code	Temperature Stability ± ppm (max)	Tuning Slope Kv ppm/V (typ)	Minimum APR (±ppm) for VDD @ 3.3 V	2.5 V	1.8 V
A	100	180	100	75	25

J	20	135	130	104	70
K	100	356	295	220	155
M	20	33	12	Note 6	Note 6

Notes:
1. For best jitter and phase noise performance , always choose the smallest Kv that meets the application s minimum APR requirements. Unlike SAW-based solutions which require higher higher Kv values to account for their higher temperature dependence , the Si55x series provides lower Kv options to minimize noise coupling and jitter in real - world PLL designs. See AN255 and AN266 for more information.
2. APR is the ability of a VCXO to track a signal over the product lifetime . A VCXO with an APR of ±25 ppm is able to lock to a clock with a ± 25 ppm stability over 15 years over all operating conditions.
3. Nominal Pull range (±) = 0.5 x V_{DD} x tuning slope.
4. Nominal Absolute Pull Range (±APR) = Pull range – stability – lifetime aging
                      = 0.5 x V_{DD} x tuning slope – stability – 10 ppm
5. Minimum APR values noted above include worst case values for all parameters .
6. Combination not available.

Example Part Number: 552AF000108DGR is a 5x7mm Dual VCXO in a 6 pad package. Since the six digit code (000108) is > 000100, f0 is 644.53125 MHz (lower frequency) and f1 is 693.48299 (higher frequency), with a 3.3V supply and LVPECL output. Temperature stability is specified as ± 50 ppm and the tuning slope is 135 ppm/V. The part is specified for a -40 to +85 C° ambient temperature range operation and is shipped in tape and reel format .
