

300mA 20V High Voltage Low Noise Low Dropout LDO

Features

- Input Voltage Range: 2.5V to 20V
- Output Voltage Range:
 - Adjustable Operation: 1.2V to 18V
 - Fixed Operation: 1.8V, 3.3V, and 5.0V
- Maximum Output Current: 300mA
- Low Dropout Voltage: 152mV at 300mA
- Low noise: $45\mu\text{V}_{\text{RMS}}$
- Output Voltage Accuracy: 2% over Line, Load and Temperature
- Low Quiescent Current: $I_{\text{GND}} = 69\mu\text{A}$
- Fast Load and Line Transient Responses
- Thermal Shutdown and Over-Current Protection
- Stable with $1\mu\text{F}$ or larger ceramic capacitors
- Operating Junction Temperature: -40°C to $+125^{\circ}\text{C}$
- SOT23-5 Package

Description

ADP7118 is a high voltage, high PSRR and low dropout voltage linear regulator capable of sourcing 300mA current. The output voltage can be adjusted from 1.2V to 18V by using external resistor divider for the adjustable version. The fixed version output voltage spans from 1.8V to 5.0V.

The ADP7118 also features internal current limit and thermal shutdown protection, as well as automatic discharge function to quickly discharge V_{OUT} in the disabled states.

Applications

- Regulation to Noise Sensitive Applications: ADC and DAC Circuits, Power for VCO Control
- Communications and Infrastructure
- Medical Devices
- Industrial and Instrumentation

Pin Descriptions

PIN Number	PIN Name	I/O	Function
1	IN	I	Input supply voltage pin. It is recommended to use a 1 μ F or larger ceramic capacitor from IN pin to ground to get a good power supply decoupling.
2	GND	-	Ground.
3	EN	I	Enable Pin. Drive EN high to turn on the regulator. Drive EN low to turn off the regulator.
4	ADJ/BYP	I	For adjustable voltage version this is feedback voltage input pin. Connect this pin to the midpoint of an external resistor divider to adjust the output voltage. Place the resistors as close as possible to this pin. For fixed voltage version this is reference bypass pin. Connect an external capacitor to this pin can reduce the output to low noise level.
5	OUT	O	Regulator output voltage pin. A 1 μ F or larger ceramic capacitor from OUT to ground is required to ensure regulator stability. The capacitor should be placed as close to the output as possible. Minimize the impedance from the OUT pin to the load.

Feature Description***Enable***

The enable pin for ADP7118 is active high. The device is enabled when the enable pin voltage is greater than $V_{IH(EN)}$ and disabled with the enable pin voltage less than $V_{IL(EN)}$. If independent control of chip enable is not needed, then connect the enable pin to the input. The ADP7118 has an internal pulldown MOSFET that connects a discharge resistor from V_{OUT} to ground when the device is disabled to actively discharge the output voltage.

Output Current Limit and Short-Circuit Protection

When overload events happen, the output current is internally limited.

Undervoltage Lockout (UVLO)

ADP7118 uses an undervoltage lockout circuit to keep the output shut off until the internal circuitry is operating properly.

Thermal Protection

ADP7118 contains a thermal shutdown protection circuit to turn off the output current when excessive heat is dissipated in the LDO.

Application Information

Typical Application for Fixed and Adjustable Output Voltage

Adjustable Output Voltage

The output voltage of the ADP7118 can be adjusted from 1.2V to 18V according to the following equation.

$$V_{OUT} = 1.2V \times \left(1 + \frac{R1}{R2}\right)$$

Input Capacitor and Output Capacitor

The ADP7118 is designed and characterized for operation with ceramic capacitors of 1μF or greater at the input and 1μF or greater at the output. Locate the input and output capacitors as near as practical to the input and output pins to minimize the trace inductance from the capacitor to the device.

Feed Forward Capacitor

A Feed-Forward Capacitor (C_{FF}) in parallel with the $R1$ resistor as shown in the Figure above can be used to improve the output noise and PSRR performance. This C_{FF} is user optional for performance improvements not for LDO stability.
